# Introduction

This is an interesting introduction to an interesting subject

### 1 Definitions

We first need to define the language of terms of our annotated  $\pi$ -calculus.

#### Definition 1

Take two countable sets,  $N := \{t, u, v, ...\}$  the set of names and  $V := \{x, y, z, ...\}$  the set of variables. The annotated terms are defined by the following grammar:

```
P,Q ::= x \leftrightarrow y \; ; \; 0_x \; ; \\ \epsilon_x.P \; ; \; \lambda_xy.P \; ; \\ u_x(t).P \; ; \; \bar{u}_x\langle v\rangle.P \; ; \\ P|_xQ \; ; \; P||_xQ \; ; \\ (\nu u)P \qquad \qquad \qquad x,y \in V \; \text{ variable introduction and modality prefixes} \\ x,y \in V \; \text{ variable introduction and modality prefixes} \\ x,y \in V \; \text{ variable introduction and modality prefixes} \\ x,y \in V \; \text{ variable introduction and modality prefixes} \\ x,y \in V \; \text{ variable introduction and modality prefixes} \\ x \in V \; \text{ parallel and synchronization} \\ u \in N \; \text{ name binding prefix} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchronization} \\ x \in V \; \text{ parallel and synchroniza
```

The synchronization rule will be used to guide the behavior of terms, thus we define a reduction system over this construction specifically, as follows:

#### Definition 2

We define a reduction rule for synchronization (that does not hold under action prefixes) as follows:

We also define rules for commuting the synchronization with other rules, at first not holding under action prefixes:

```
\begin{aligned} (P|_xQ)||_yR &\geq (P||_yR)|_xQ & \text{symmetric in } ||,\ y \not\in fv(Q) & 5a \\ (P|_xQ)||_yR &\geq P|_x(Q||_yR) & \text{symmetric in } ||,\ y \not\in fv(P) & 5b \\ \epsilon_x.P||_yQ &\geq \epsilon_x.(P||_yQ) & \text{symmetric in } ||,\ g \not\in fv(Q) & 6a \\ \lambda_xy.P||_zQ &\geq \lambda_xy.(P||_zQ) & \text{symmetric in } ||,\ y \not\in fv(Q) & 6b \\ (\nu u)P||_xQ &\geq (\nu u)(P||_xQ) & \text{symmetric in } ||,\ u \not\in fn(Q) & 6c \end{aligned}
```

And we extend it into  $\gtrsim$  as follows, allowing for it to act on (and under) action prefixes:

```
u_x(t).P||_yQ \gtrsim u_x(t).(P||_yQ) symmetric in || 6d \bar{u}_x\langle v\rangle.P||_yQ \gtrsim \bar{u}_x\langle v\rangle.(P||_yQ) symmetric in || 6e
```

Relation  $\rightarrow$  is also extended into  $\rightsquigarrow$  by allowing it to act under action prefixes (no specific rule added).

We would like these arrows to have a confluent behavior. For that, we need equivalences, that we will define below.

### Definition 3

We define a congruence rule, that does not act on action prefixes:

$$(P|_{x}Q)|_{y}R \equiv (P|_{y}R)|_{x}Q$$

$$P|_{x}(Q|_{y}R) \equiv Q|_{y}(P|_{x}R)$$

$$(P|_{x}Q)|_{y}R \equiv P|_{x}(Q|_{y}R)$$

$$Y \notin fv(P), x \notin fv(Q) \quad a_{2}$$

$$y \notin fv(P), x \notin fv(R) \quad b$$

$$P|_{x}\alpha_{y}.Q \equiv \alpha_{y}.(P|_{x}Q)$$

$$\alpha_{x}.\beta_{y}.P \equiv \beta_{y}.\alpha_{x}.P$$

$$(\nu u)P|_{x}Q \equiv (\nu u)(P|_{x}Q)$$

$$(\nu u)\alpha_{x}.P \equiv \alpha_{x}.(\nu u)P$$

$$x \leftrightarrow y \equiv y \leftrightarrow x$$

$$y \notin fv(Q), x \notin fv(R) \quad a_{1}$$

$$y \notin fv(P), x \notin fv(R) \quad b$$

$$symmetric in |, \alpha \in \{\epsilon., \lambda.z\}, y, t \notin fv(P) \quad c$$

$$\alpha_{x}.\beta_{x}.\theta_{x}.$$

And we also extend it into  $\cong$  by allowing  $\alpha, \beta$  to be action prefixes in rules c, d:

$$\alpha., \beta. \in \{\epsilon., \lambda.z, u.(t), \bar{u}.\langle v \rangle\};$$

as well as in rule f:

$$\alpha \in \{\epsilon, \lambda, z, v(t), \bar{v}(w), u \neq v, u \neq t, u \neq w\}.$$

As said before, the first property we would like to have is the confluence of our arrows, that act as reduction rules in our annotated system. That is done for each one up to the corresponding equivalence defined above.

#### Proposition 4

Changes to go here:  $\rightarrow$  is strictly confluent,  $\geq$  is confluent up to  $\equiv$  and is a simulation for  $\rightarrow$ . Maybe 2 different propositions? Also rewrite the proof to go with the new propositions. Relation  $\rightarrow$  is confluent up to  $\equiv$ , and relation  $\rightsquigarrow$  is confluent up to  $\cong$ 

Most cases are treated in the  $\rightarrow$  rule with  $\equiv$ , and we can note that rules 1 through 4 interacting with any rule means that one of the rules is a sub-term of the other. That means that, should we choose to reduce the inner rule first, we only replace the subterm in question with the result of the innermost rule, and should we choose to reduce the outer rule first, the innermost rule can still be applied in the subterm that has not been touched (worst case scenario would be a substitution in this term, but that does not affect the application of the rule). Cases where both choices lead to non-strictly equal terms are rules 5 and 6 interacting with themselves or each other. We detail them below: Rule 5 against rule 5: there are 4 cases, depending on where the variable cut against is situated. The variable is noted as an exponent in the terms where it appears, and only 2 cases are treated (as the other two are their complements, and are treated the same):

Rule 6 against rule 6 works the same, here is an example with  $\epsilon$  and  $\nu$ :

$$\begin{array}{cccc} \epsilon_{x}. & ||y(\nu u)Q|| \\ & & \geq_{6c} \\ \epsilon_{x}. & (P||_{y}(\nu u)Q) & (\nu u)(\epsilon_{x}. P||_{y}Q) \\ & & \downarrow_{\geq_{6c}} & & \downarrow_{\geq_{6a}} \\ \epsilon_{x}. & (\nu u)(P||_{y}Q) & \equiv_{f} & (\nu u)\epsilon_{x}. & (P||_{y}Q) \end{array}$$

Other cases in the possible 6 against 6 rules are treated in the exact same manner. The last set of cases is a rule 5 against a rule 6. Those are all treated the same way as well, so we only treat two examples (one for 5a and one for 5b):

The specific cases added by  $\leadsto$  and  $\gtrsim$  are treated the exact same way, and are confluent with  $\cong$ .

Below maybe not needed after above rewrite

We also need to be sure the equivalence does not change the reduction, *ie.* that two equivalent terms have the same reductions. That is assured by showing the equivalence is a bisimulation relation.

DO WE NEED TO REMIND THE DEFINITION OF A (BI)SIMULATION HERE?

#### Proposition 5

Relation  $\equiv$  is a bisimulation for reduction  $\geq$ ? $\rightarrow \geq$ \*.

### 2 Typing decorated terms with MLL

Section intro here, stating MLL seems a good system to type terms of the decorated calculus

#### Definition 6

The typing system over MLL is given by the following rules:

Rules for neutral elements:

$$\frac{P \vdash \Gamma}{\epsilon_x.P \vdash \Gamma, x:\bot} \ BOT \qquad \qquad \frac{x \to y \vdash x:E^\bot, y:E}{x \to y \vdash x:E^\bot, y:E} \ SUB$$

Construction rules:

$$\frac{P \vdash \Gamma, x : E - Q \vdash \Delta, x : F}{P|_x Q \vdash \Gamma, \Delta, x : E \otimes F} \ PARA \qquad \frac{P \vdash \Gamma, x : E, y : F}{\lambda_x y . P \vdash \Gamma, x : E \Im F} \ LAM \qquad \frac{P \vdash \Gamma, x : E - Q \vdash \Delta, x : E^{\perp}}{P||_x Q \vdash \Gamma, \Delta} \ CUT$$

Action rules:

$$\frac{P \vdash \Gamma, x : A[v/t]^{\perp}}{\bar{u}_x \langle v \rangle. P \vdash \Gamma, x : \exists_u t. A^{\perp}} \ IN \qquad \qquad \frac{P \vdash \Gamma, x : A \quad t \not\in \Gamma}{u_x(t). P \vdash \Gamma, x : \forall_u t. A} \ OUT$$

Nu rule:

$$\frac{P \vdash \Gamma \quad u \not\in \Gamma}{(\nu u)P \vdash \Gamma} \ NU$$

One important thing to note here, is that for PARA and CUT rules,  $\Gamma$  and  $\Delta$  are disjoint. The other important thing is that the synchronization construction becomes a CUT operation in the typing system. This rule has elimination transformations, given by the arrows  $\rightarrow$  and  $\rightsquigarrow$  defined in 2. Properties we would like to emerge from such a construction would be that the arrows preserve typing, and that their application for cut elimination terminates.

### Proposition 7

Cut elimination holds and terminates, for both  $\rightarrow$  under  $\equiv$  and  $\rightsquigarrow$  under  $\cong$ .

ightharpoonup proof here

## 3 Links with the usual $\pi$ -calculus

### Definition 8

Define  $\pi$ -calculus

### Definition 9

Define projection  $\lfloor \cdot \rfloor$ 

### Proposition 10

Something about  $\rightarrow$  and  $\equiv$  related to projection

 $\triangleright$  proof here

Open about  $\leadsto$  here or in the conclusion.

## Conclusion

A nice conclusion and working trails for later here.
